

# ORGANIZATION SECURITY POLICY

## HOW MUCH MONEY DO YOU SPEND ON DATA UNAVAILABILITY, LOSS OR MISUSE?

- We will help you to find out from where the utmost risk is threatening.

## WHICH SECURITY MEASURES WILL NOT ONLY BE EXPENSES WITHOUT EFFECT?

- Along with you, we will specify security measures with the best benefit.

## DOES YOUR DATA SECURITY MEET LEGISLATURE REQUIREMENTS?

- We will find the risks and work up the security documentation.

## SECURITY POLICY FOR YOUR DATA

Your data are more valuable than material holdings. The necessity to secure their protection is evident, but the informal approach is not sufficient anymore. The systematic control of information security alone will enable right targeting, exact planning and effective investment utilization.

### Control System of Data Security (ISMS)

- Reduces the risk of data leakage, loss, or devaluation.
- Improves the organization perception and strengthens the customer confidence.
- Ensures compliance with legislature requirements.
- Answers the question whether the spent investments correspond to threatening damages.

### The control services of data security help you

- Evaluate your data and to identify the most significant ones,
- Find relevant risks threatening the data,
- Define the plan of managing these risks.

## SERVICES OF DATA SECURITY CONTROL

### Introductory Analysis of Data Security

- We will map your work with data.
- We will set the targets and specify the scope of data security control.
- We will acquire the management support and draw up the plan of further steps.

### Implementation of Data Security Control System

- The ISMS implementation can also be done step by step according to the real need of your organization. We can start with the most important divisions or activities and run on gradually.
- As a frame, we use the ISO 27000 standards family. You can accordingly use every partial step for the eventual future certification after this norm as well as the cybernetic security law.

### Information Assets Inventory

- We will describe and evaluate your information assets. You will know what you have to protect and why.

### Risk Assessment

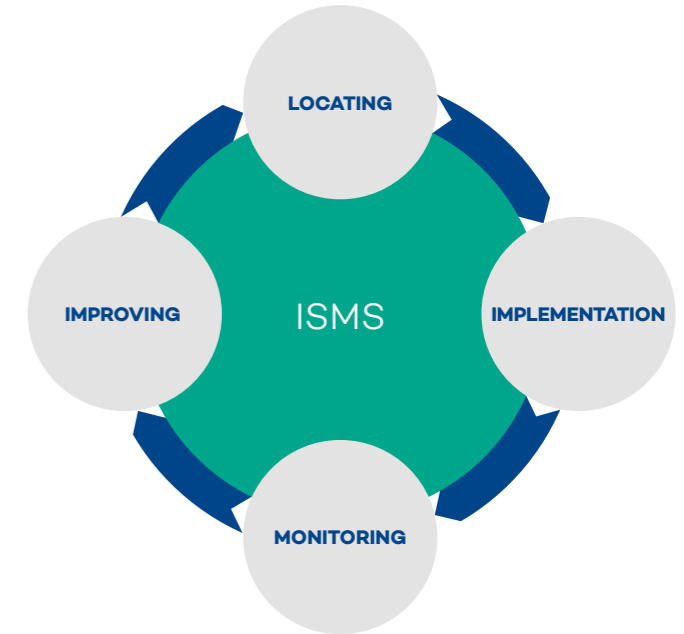

- We will find vulnerabilities – threatened points of your systems – evaluate the possible impacts and their probability. We will compare the risk level with the level acceptable for you.

### Risk Managing Plan

- We will choose appropriate measures and recommend the order of their implementation.

### Consultations of Data Security Development

- New challenges (threats, legislature, or new ways of data usage) always appear in the world of security. The ISMS implementation cannot be considered as a simple step, but as a continual process. It is therefore necessary continuously to monitor and evaluate everything and to plan further adjustments and development according to the findings.
- As a part of ISMS implementation, we will provide you a free service of data security development consultations for the next year.
